

Stakeholder Sign-Off

MPC as a Layer 2 Service to Cardano

Project Overview

This project, funded under Project Catalyst (Proposal #1200045), is a joint effort between Profila AG and Partisia Blockchain to build a cross-chain integration that enables privacy-preserving Multi-Party Computation (MPC) as a Layer 2 service to the Cardano blockchain.

The implementation connects an Aiken smart contract on Cardano with a Partisia Blockchain MPC smart contract via a relay service. Users can initiate MPC computation requests on Cardano, have them processed through Partisia's MPC engine with encrypted secret inputs, and receive results back on-chain - all without exposing private data.

Milestones

Milestone 1

Aiken smart contract on Cardano preprod testnet with MPC initiation functionality, unit tests, documentation, and video demo.

Milestone 2

Partisia Blockchain MPC smart contract and relay service connecting Cardano to Partisia, with deployment evidence and video demo.

Milestone 3

Secret input submission to Partisia MPC contract with privacy-preserving computation, on-chain evidence, and video demo.

Milestone 4

End-to-end result flow from MPC computation back to Cardano with closeout report and final video demo.

Sign-Off Agreement

By signing below, both parties confirm that they have reviewed the deliverables for this project and approve

the implementation as meeting the agreed-upon scope and acceptance criteria for all milestones.
